Public Economics: Tax & Transfer Policies (Master PPD & APE, Paris School of Economics) Thomas Piketty Academic year 2014-2015

Lecture 6: Capital Taxes over Time & across Countries (February 10th 2015) (check <u>on line</u> for updated versions)

Basic notions & notations

- National income Y = F(K,L) = Y_K + Y_L = rK + vL with r = average rate of return v = average wage rate
- Individual income y_i = y_{Ki} + y_{Li} = r_ik_i + v_il_i with r_i = individual rate of return, v_i = individual wage rate
- Individual capital (wealth) k_i comes from past savings and/or from inheritance (or sometime from various forms of appropriations or privatization processes, e.g. for natural ressources: land, oil, gold, etc.)
- In order to study capital taxation, one needs to specify where k_i comes from, i.e. one needs a dynamic, multiperiod model: static, one-period model are fine to study labor income taxation, but cannot be used to study capital taxation → see next lecture for explicit dynamic models; today = mostly a description of existing capital taxes

Reminder: what is capital?

- K = real-estate (housing, offices..), machinery, equipment, patents, immaterial capital,..
 (≈ housing assets + business assets: about 50-50)
 Y_K = capital income = rent, dividend, interest, profits,..
- In rich countries, $\beta = K/Y = 5-6$ ($\alpha = Y_K/Y = 25-30\%$) (i.e. average rate of return r = $\alpha/\beta = 4-5\%$)
- Typically, in France, Germany, UK, Italy, US, Japan: Y ≈ 30 000€ (pretax average income, i.e. national income /population), K ≈ 150 000-180 000€ (average wealth, i.e. capital stock/population); net foreign asset positions small in most coutries (but rising); see <u>this graph</u> & <u>inequality course</u> for more details

Key distinction: taxes on flows versus stock

- Total tax burden EU27 ≈ 39% of GDP, incl. 9% in capital taxes (US: 28%, incl. 8% in capital taxes). See <u>Eurostat 2013</u>
- With a capital share α=Y_k/Y≈30%, this is equivalent to an average tax rate ≈ 30% on all capital income flows
- With a capital/income ratio β=K/Y≈600%, this is equivalent to an average tax rate ≈ 1,5% on the capital stock
- \rightarrow both forms of capital taxes raise \approx 9% of GDP
- In practice, there is a large diversity of capital taxes: stockbased (one-off inheritance and transfer taxes, annual property or wealth taxes) or flow-based (corporate income taxes, taxes on capital income: rental income, interest, dividend, k gains etc.); why are they not all equivalent ?

In the simplest economic models, we have a general equivalence result: if the rate of return on capital is equal to r and is the same across all individuals & over all assets (=perfect capital markets), then a tax at rate t_k on the capital income flow is exactly equivalent to a tax at rate τ_k on the capital stock, with:

$$\tau_k = r \times t_k$$
, or $t_k = \tau_k / r$

- If r=5%, it is equivalent to tax capital stock at τ_k =1% per year or to tax capital income flow at t_k =20% per year
- If r=4%, then τ_k =1% on stock \leftrightarrow t_k=25% on income flow

- Exemple: assume that you own an appartement worth k=1 million €, and that its annual rental value is equal to y_k=40 000€, i.e. r = 4%
- Assume you have to pay a property tax (taxe foncière) at a rate τ_k=1%: 1% of k=10 000€ in tax
- It is equivalent to pay a tax at rate t_k=25% on the rental income (real or imputed):

25% of y_k=40 000€ = 10 000€ in tax

- Same computations with k=100 000€, y_k=4 000€
- Note: in France, average rate of property tax ≈0,5%; in the US or UK, it is closer to ≈1%

- In practice, the key reason why taxes on the capital stock and taxes on the capital income flow are not equivalent is the existence of capital market imperfections: the rate of return r_i varies across assets & individuals
- For individuals with r_i > average r, then it is better to have stock taxes than flow taxes (& conversely for individuals with r_i < average r)
- If $r_i=10\%$, $\tau_k=1\%$ on stock $\leftrightarrow t_k=10\%$ on income flow
- If if $r_i=2\%$, $\tau_k=1\%$ on stock $\leftrightarrow t_k=50\%$ on income flow
- Key argument in favor of taxes on capital stock rather than on flow (i.e. capital tax rather than income tax): they put incentives to get a high return on k (Allais)

- In the EU & US, capital taxes = 8%-9% GDP
- Typical structure:
- inheritance taxes <1% GDP (say, 5%-10% of a 10% tax base)
- + annual wealth & property taxes 1%-2% GDP (say, 0,5% of a 200%-400% tax base)
- + corporate profits tax 2%-3% GDP (say, 20%-30% of a 10% tax base)
- + personal capital income tax 2%-3% GDP (say, 20%-30% of a 10% tax base)

Exemple of inheritance taxes

- Basic distinction:
- Estate taxes : tax rates depend on the total "estate" (real estate: immobilier + personal estate: mobilier, incl. financial), i.e. the total wealth left by the decedent, irrespective of how it is split between successors
 - = applied in US & UK (complete testamentary freedom... but egalitarian default rules if no testament)
- Inheritance taxes: tax rates depend on the wealth received by each successor (part successorale) and the kin relationship (children vs stangers)
 - = applied in France & Germany (limited testamentary freedom; rigid transmission rules)
 - → in order to understand how the tax is computed, one first needs to understand how the wealth is divided

- Rigid transmission rules in France: the 1/n+1 rule
- « Réserve héréditaire » (this has to go the children, no matters what) = n/n+1
- « Quotité disponible » (what you can transmit to individuals other than your children) = 1/n+1, with n = number of children
- With n = 1, free disposal of 50% of your wealth
- With n =2, free disposal of 33% of your wealth
- With n=3 or more, free disposal of 25% of your wealth; the other 75% is divided equally among children
- These basic rules were unchanged since 1804

- Default matrimonial regime: « community of acquisition » (« communauté réduite aux acquêts »)
- Married couple wealth $w = w_c + w_1 + w_2$
- with w_c = community assets = assets acquired during marriage
- w₁, w₂ = own assets (biens propres) = inherited by each spouse (or acquired before marriage)
- Only w_c is split 50-50
- Other matrimonial regimes: separate property; universal community (very rare)

N	larginal ve avo	rado tax rato	e: illustration	with Franch '	2012_2012 lpb/	oritanco Tax
<u>IV</u>	iai yii iai vs ave	Taye lax Tale	5. IIIU511 atioi		2012-2013 11118	
French 2012 2013 tax scho	dulo (applied to	2012 2012 4	lacadante).	Inheritance brackets		Marginal tax rate
(haràme des droits de successions)		2012-2013 u		(in excess of exemption) (€)		(%)
(see www.impots.gouv.fr)				0	8 072	5.0%
				8 072	12 109	10,0%
This tax schedule applies "in direct line", i.e. for			12 109	15 932	15,0%	
transmissions from parents to children, on individual		15 932	552 324	20,0%		
estate shares ("parts successorales")				552 324	902 838	30,0%
The exemption for children is equal to:		100 000		902 838	1 805 677	40,0%
Inter vivos gift: exemption every 15 year		•		1 805 677		45,0%
Spouses: tax exempt						
Note: until 2011, top rate =	40% instead of	45%				
Key change in 2012: in 20	07-2011, child	ren exemptio	on = 150 000€	every 6 year		
I.e. if they start giving to the	eir children at a	ge 50 and die	at age 80, ea	ch parent could	I transmit 6 x 1	50 000€ = 900 000€ to
each children with zero tax;	i.e. a couple w	ith two childre	en could transr	nit 3,6 millions	€ with zero tax.	
Since 2012, such parents of	an "only" transi	mit 4 x (3 x 10	0 000€) = 1,2	millions € with	zero tax	
In practice, less than 5% of	direct line tran	smissions pay	/ inheritance ta	axes (but this d	epends a lot on	tax planning)
(in 1992-2006: children exe	emption = 50 00	0€, every 10 <u>y</u>	year)			

Exemple 1: married couple with wealth w = 1 million € and two kids, no inter vivos gift

Assumption: each spouse owns 500 000€, and the couple wishes to transmit 500 000€ to each kid

Assume that the first decedent transmits the full property of 500 000€ to kids; then the second decedent transmits the remaining 500 000€ to the kids Inheritance tax at first death: 5% x (8 072-0) + 10% x (12 109-8 072)+ 15% x (15 932-12 109) + 20% x (250 000 - 15 932 - 100 000) = 28 194€ = 11,3% of 250 000€

Estate tax at second death = same computation = 28 194€ = 11,3% of 250 000€

Total estate tax paid by each children = 56 389€ = 11,3% of 500 000€

Total inheritance tax paid = 112 777€ = 11,3% of 1 000 000€

Effective tax rate = 11,3% < Marginal tax rate=20%

Exemple 2: married couple with wealth w = 10 million €and two kids, no inter vivos gift

Assumption: each spouse owns 5 millions €, and the couple wishes to transmit 5 millions € to each kid

Assume that the first decedent transmits the full property of 5 millions € to kids; then the second decedent transmits the remaining 5 millions € to the kids

Inheritance tax at first death: 5% x (8 072-0) + 10% x (12 109-8 072)+ 15% x (15 932-12 109) + 20% x (552 324 - 15 932) + 30% x (902 838 - 552 324) + 40% x (1 805 677 - 902 838) + 45% x (2 500 000 - 1 805 677 - 100 000) = 842 394€ = 33,7% of 2 500 000€

Estate tax at second death = same computation = 842 394€ = 33,7% of 2 500 000€

Total inheritance tax paid by each children = 1 684 789€ = 33,7% of 5 000 000€

Total inheritance tax paid = 3 369 577 € = 33,7% of 10 000 000€

Effective tax rate = 33,7% < Marginal tax rate = 45%

- Other exemples of computations using tax schedules from France and the US: see <u>excel file</u>
- Chaotic evolution of top inheritance tax rates over time and across countries: see graph
- On the historical evolution of inheritance taxes:
- K. Scheve & D. Stasavadge, "Democracy, War & Wealth – Evidence from Two Centuries of Inheritance Taxation", 2011 [article in pdf format]

The top marginal tax rate of the inheritance tax (applying to the highest inheritances) in the U.S. dropped from 70% in 1980 to 35% in 2013. Sources and series: see piketty.pse.ens.fr/capital21c.

Figure 14.2. Top inheritance tax rates, 1900-2013

Progressive wealth taxes

• Exemple with French ISF: see <u>excel file</u>

 On the evolution of the French wealth tax (ISF) : See Zucman, G., "Les hauts patrimoines fuient-ils l'ISF? Une estimation sur la période 1995-2006 », PSE Master Thesis, 2008 [article in pdf format]

French 2008 wealth tax schedule (applied to 1/1/2008 wealth):	threshold	marg. rate
(barème de l'impôt sur la fortune (ISF))	(€)	(%)
(see www.impots.gouv.fr)	770 000	0,55%
	1 240 000	0,75%
	2 450 000	1,00%
	3 850 000	1,30%
	7 360 000	1,65%
	16 020 000	1,80%

(no major reform in 2008-2011, except small adjustement for inflation)

Exemple with wealth w = 1 million €

0,55% x (1 000 000 - 770 000) = 1 265€ = 0,13% of 1 000 000 €

>>> marginal wealth tax rate = 0,55%, average wealth tax rate = 0,13%

Implicit wealth income tax rate: If r = 2%, i.e. $rw = 20\ 000 \in$, then average wealth income tax rate = 6,32% If r = 10%, i.e. $rw = 100\ 000 \in$, then average wealth income tax rate = 1,26%

Exemple with wealth w = 10 million €

0,55% x (1 240 000 - 770 000) + 0,75% x (2 450 000 - 1 240 000) + 1% x (3 850 000 - 2 450 000) + 1,30% x (7 360 000 - 3 850 000) + 1,65% x (10 000 000 - 7 360 000) = 114 850€ = 1,15% of 10 000 000 €

>>> marginal wealth tax rate = 1,65%, average wealth tax rate = 1,15%

Implicit wealth income tax rate: If r = 2%, i.e. $rw = 200\ 000 \in$, then average wealth income tax rate = 57,43% If r = 5%, i.e. $rw = 500\ 000 \in$, then average wealth income tax rate = 22,96% If r = 10%, i.e. $rw = 1\ 000\ 000 \in$, then average wealth income tax rate = 11,48%

Marginal vs average tax rates: illustration with French 2012 Wealth Tax

French 2013 wealth tax schedule (applied to 1/1/2013 wealth):	threshold	marg. rate
(barème de l'impôt sur la fortune (ISF))	(€)	(%)
(see www.impots.gouv.fr)	800 000	0,50%
	1 310 000	0,70%
	2 570 000	1,00%
	5 000 000	1,25%
	10 000 000	1,50%
