**Should We Reduce Class Size  
or School Segregation ?**

**Theory and Evidence from France**

Thomas Piketty

ENS-EHESS, Paris-Jourdan

**Question :** In order to improve school achievement of lower-class children and reduce the inequality of educational opportunities, should we put more money into lower-class schools (lower class size) ("positive discrimination"), or should we force lower-class and upper-class kids to go to the same school (peer effects, via busing or housing policy) ("social integration")?

One possible answer: we should do both!

... Except that there is a trade-off: in case of complete social integration, all schools are alike and it is no longer possible to target resources toward disadvantaged children; conversely, social integration is less valuable when there is substantial positive discrimination

>>> Are positive discrimination and social integration complementary or substitute?

## What I do this paper

**1.** I construct a simple theoretical model to investigate this trade-off. Key results:

- (a) It all depends on the relative strength of the class size effect and the peer effect...
- (b) Interior optima can exist

**2.** I estimate the coefficients of the model using French data (“panel primaire 1997” = panel of 10,000 primary school students, test scores in 1<sup>st</sup> and 3<sup>rd</sup> grade) and regression discontinuity design (Angrist-Lavy 1999). Key results:

- (a) IV class size effects larger than OLS estimates.  
Class size effects much larger than peer effects.
- (b) For these parameters, Rawlsian social optimum = full segregation (even if integration costless!)
- (c) However for realistic levels of positive discrimination, increasing integration (as compared to current situation) is always better.

## **Theoretical model: social integration vs positive discrimination**

Total number of children = N

Type 0 = socially disadvantaged children

Type 1 = socially advantaged children

Proportion of advantaged children =  $p^*$

Two neighborhoods/zones :

Zone 0 = fraction  $1-\mu$  of children

Zone 1 = fraction  $\mu$  of children

Fraction of advantaged children in zone 0 =  $p_0$

Fraction of advantaged children in zone 1 =  $p_1$

$p_0 \leq p_1$  (zone 0 = disadvantaged zone)

$$(1-\mu) p_0 + \mu p_1 = p^*$$

$$\text{i.e. } p_1 = (p^* - (1-\mu)p_0)/\mu$$

Class size in zone 0 =  $n_0$

Class size in zone 1 =  $n_1$

In principle  $n_0 \leq n_1$ , i.e. positive discrimination benefits the disadvantaged zone

Average class size =  $n^*$

$$(1-\mu)/n_0 + \mu/n_1 = 1/n^*$$

$$\text{i.e. } n_1 = \mu/(1/n^* - (1-\mu)/n_0)$$

$s_{00}$  = average test score obtained by disadvantaged children in disadvantaged zone

$s_{01}$  = average test score obtained by disadvantaged children in advantaged zone

$s_{10}$  = average test score obtained by advantaged children in disadvantaged zone

$s_{11}$  = average test score obtained by advantaged children in disadvantaged zone

Assumption: scores vary linearly with peer group composition and class size:

$$s_{00} = s_{00i} + a_0 (p - p_{0i}) - b_0 (n - n_{0i})$$

$$s_{01} = s_{01i} + a_0 (p - p_{1i}) - b_0 (n - n_{1i})$$

$$s_{10} = s_{10i} + a_1 (p - p_{0i}) - b_1 (n - n_{0i})$$

$$s_{11} = s_{11i} + a_1 (p - p_{1i}) - b_1 (n - n_{1i})$$

$a_0$  ,  $a_1$  = peer effects parameter

$b_0$  ,  $b_1$  = class size parameter

(simulations:  $a_0 = 5$  ,  $a_1 = 0$  ,  $b_0 = 0,7$  ,  $b_1 = 0,25$ )

$s_0$  = average score of disadvantaged children  
(weighted average of  $s_{00}$  and  $s_{01}$ )

$s_1$  = average score of advantaged children  
(weighted average of  $s_{10}$  et  $s_{11}$ )

Question : what are the policy parameters  $(p_0, n_0)$  which maximize  $s_0(p_0, n_0)$  ?

For a given  $p_0$ , the maximum  $s_0(p_0, n_0)$  is obtained for  $n_0^*(p_0)$  given by :

$$n_0^*(p_0) = (1-\mu) n^* + \mu n^* (1-(p^*-p_0)/(\mu(1-p_0)))^{0,5}$$

$n_0^*(p_0)$  is an increasing function of  $p_0$

i.e. socially optimal disadvantaged class size is lower when social segregation is greater (better targeting of resources)

$n_0^*(p_0) = n^*$  if  $p_0=p^*$  (i.e. positive discrimination is useless in case of complete social integration).

For a given  $n_0$ , the maximum of  $s_0(p_0, n_0)$  is obtained for  $p_0^*(n_0)$  given by :

If  $n_0 < n_0^{**}$ , then  $p_0^*(n_0) = 0$

If  $n_0 > n_0^{**}$ , then

$$p_0^*(n_0) = p^* - \mu b_0 (\mu n^*/(1-(1-\mu)n^*/n_0) - n_0)/2a_0$$

-

$$\text{(with } n_0^{**} = (n^* - 2a_0 p^*/\mu b_0 + ((n^* - 2a_0 p^*/\mu b_0)^2 + 8a_0 p^* n^* (1-\mu)/\mu b_0)^{0.5})/2 \text{ )}$$

$p_0^*(n_0)$  is an increasing function of  $n_0$

i.e. socially optimal segregation is an increasing function of the level of class size targeting

$p_0^*(n_0) = p^*$  if  $n_0 = n^*$  (i.e. complete social integration is optimal in the absence of positive discrimination).

For the estimated parameters,  $n_0^{**} = 18,41$  (cf. graph 7 below).

Global Rawlsien Optimum : it all depends on  $q=a_0/b_0$

Proposition : There exists  $q^*$ ,  $q^{**}>0$  such that :

(a) If  $q < q^{**}$ , then the global optimum is  $p_0^*=0$  and  $n_0^*=n_0^*(0)$  (maximal positive discrimination).

(b) If  $q > q^*$ , then the global optimum is  $p_0^*=p^*$  and  $n_0^*=n^*$  (complete sociale integration).

(c) Si  $q^* < q < q^{**}$ , then the global optimum is interior

For the given parameters,  $q^*=13,2$ . With  $a_0=5$  and  $b_0=0,7$ , we have  $q=7,1$ . So it looks as if we are well into the  $q < q^*$  range, i.e. social optimum = complete segregation and extreme positive discrimination.

## Data

Main data source : panel primaire 1997

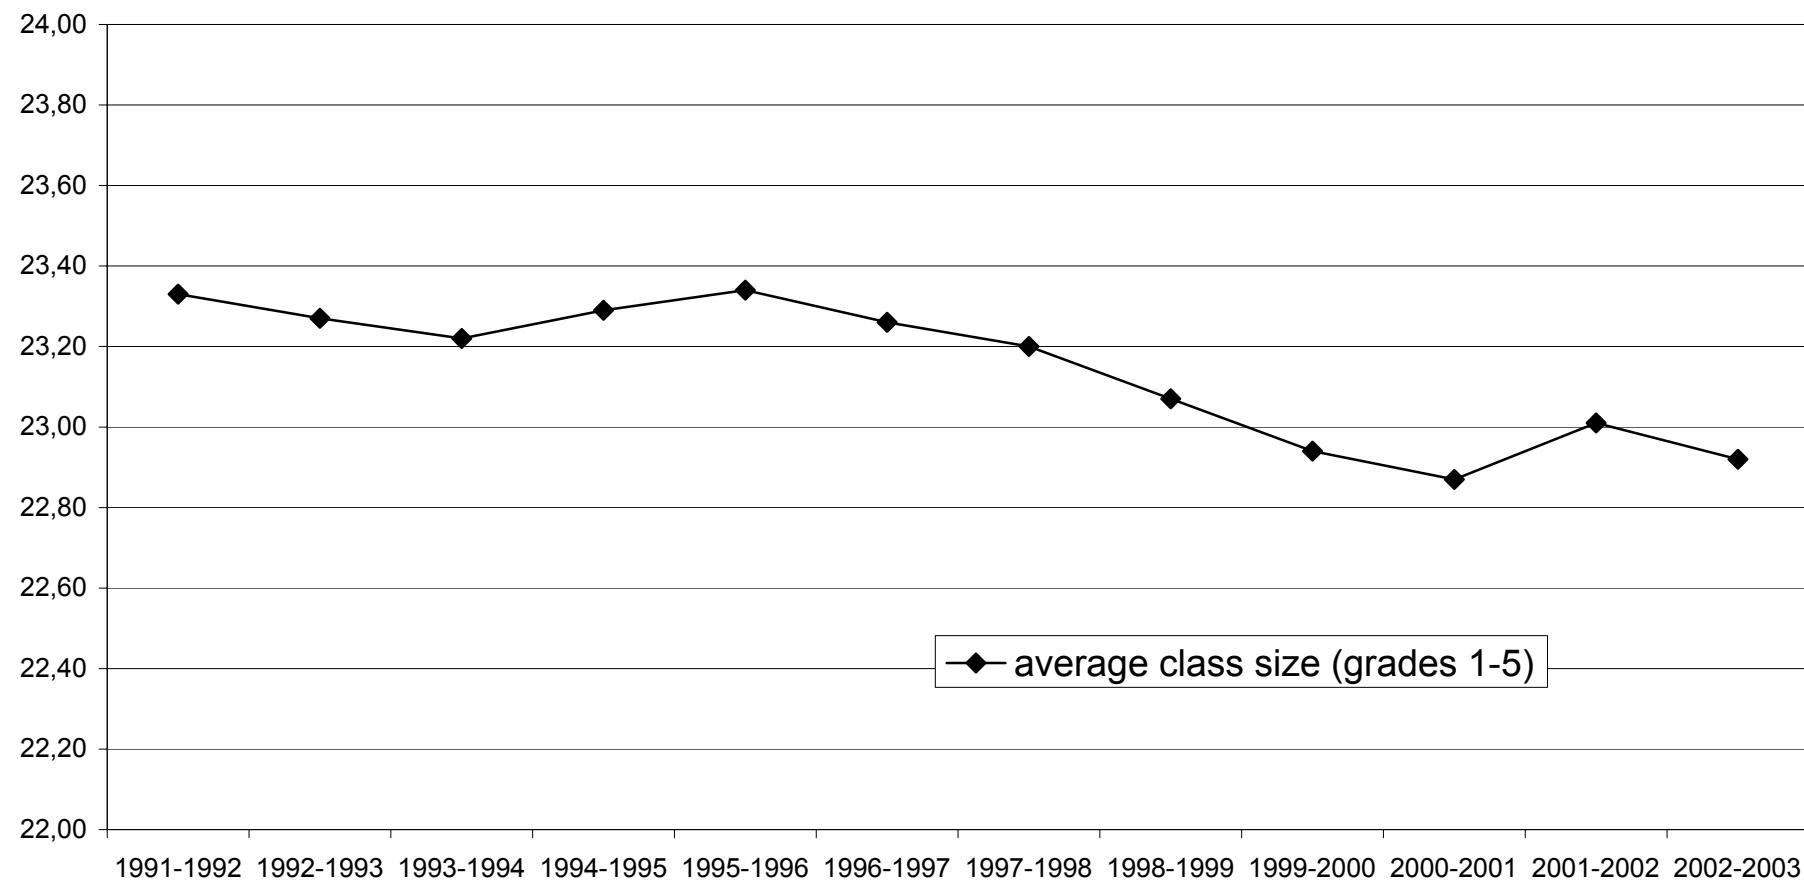

Panel based upon a national representative sample of 9639 children entering grade 1 in 1997.

Annual administrative data + 1999 family survey

Test scores in French and Maths at the beginning of grade 1 (sept 1997) and grade 3 (sept 1999)

Other data set : exhaustive administrative files covering all French primary schools

**Graph 1: Average class size in French primary schools, 1991-2003**

Source: Author's computations based upon exhaustive administrative files for French primary schools ("enquête n°19")

**Table 1: Test scores in grade 1 and 3 in "panel primaire 1997" - Descriptive statistics**

Source : Author's computations using "panel primaire 1997" (MEN-DEP)

Note : "Zep" means "priority education zone". During school year 1997-1998, grade 1 children in Zep schools (12,6% of all children) had an average class size of 21,67, vs 22,36 in non-Zep schools (87,4% of all children). "PCS" refers to INSEE occupational scale.

## **Empirical Estimates**

### **OLS Estimates**

$$s_i = b n_i + f x_i + \varepsilon_i$$

$s_i$  = grade 3 test score

$n_i$  = grade 2 class size

$x_i$  = controls (socio-dem controls + grade 1 test score)

$\varepsilon_i$  = error term

**Table 2: The impact of class size on test scores: naïve estimates (OLS)**

<b>Panel A: Impact on grade 3 Maths test scores (sept 1999)</b>					
	All children		Children with gr.1 score below median	Children with gr.1 score above median	
Class size grade 2 (s.e.)	<b>0,169 **</b> (0,066)	<b>-0,205 ***</b> (0,077)	<b>-0,312 ***</b> (0,065)	<b>-0,449 ***</b> (0,109)	<b>-0,183 **</b> (0,082)

Source : Author's computations using "panel primaire 1997" (MEN-DEP)

Note : The table reads as follows: when grade 2 class size increases by one unit, average math score at the beginning of grade 3 increases by 0,169 point.

## Theoretical class size

$$c^*(e) = \text{int}(e/30) + 1$$

$$n^*(e) = e/c^*(e) = e / [\text{int}(e/30)+1]$$

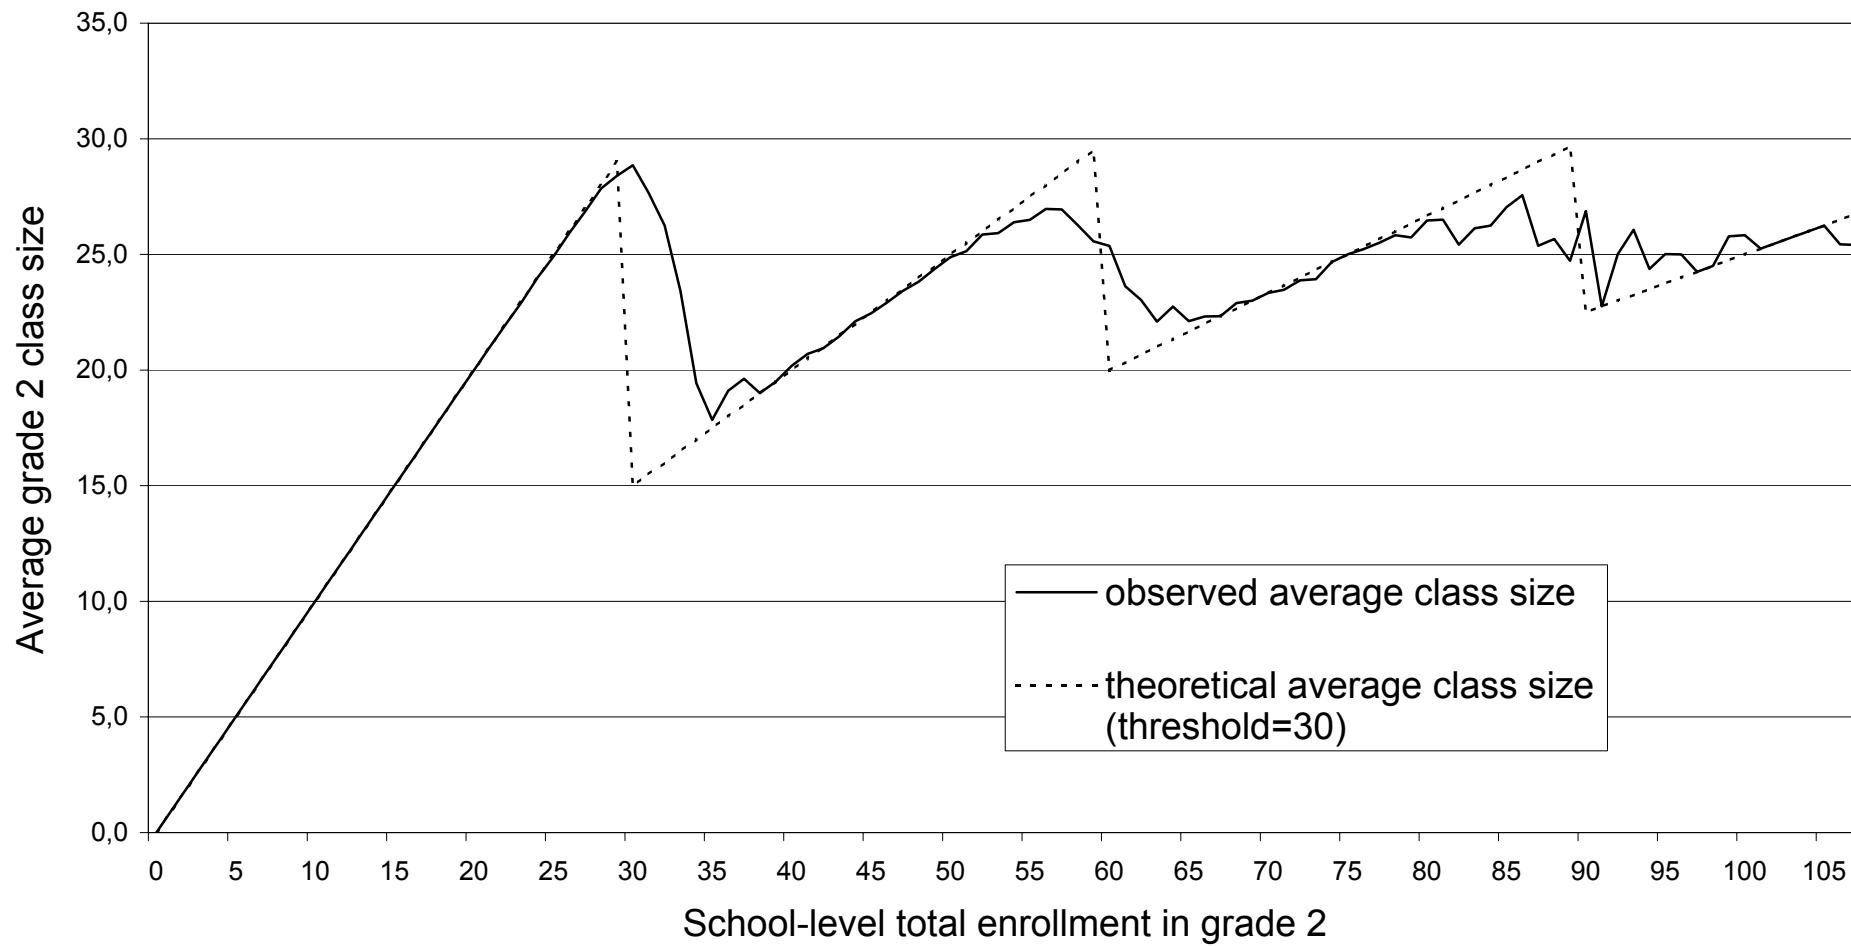

$\text{int}(x)$  = closest integer below  $x$

$e$  = school-level total grade 2 enrollment

$c^*(e)$  = theoretical number of grade 2 classes

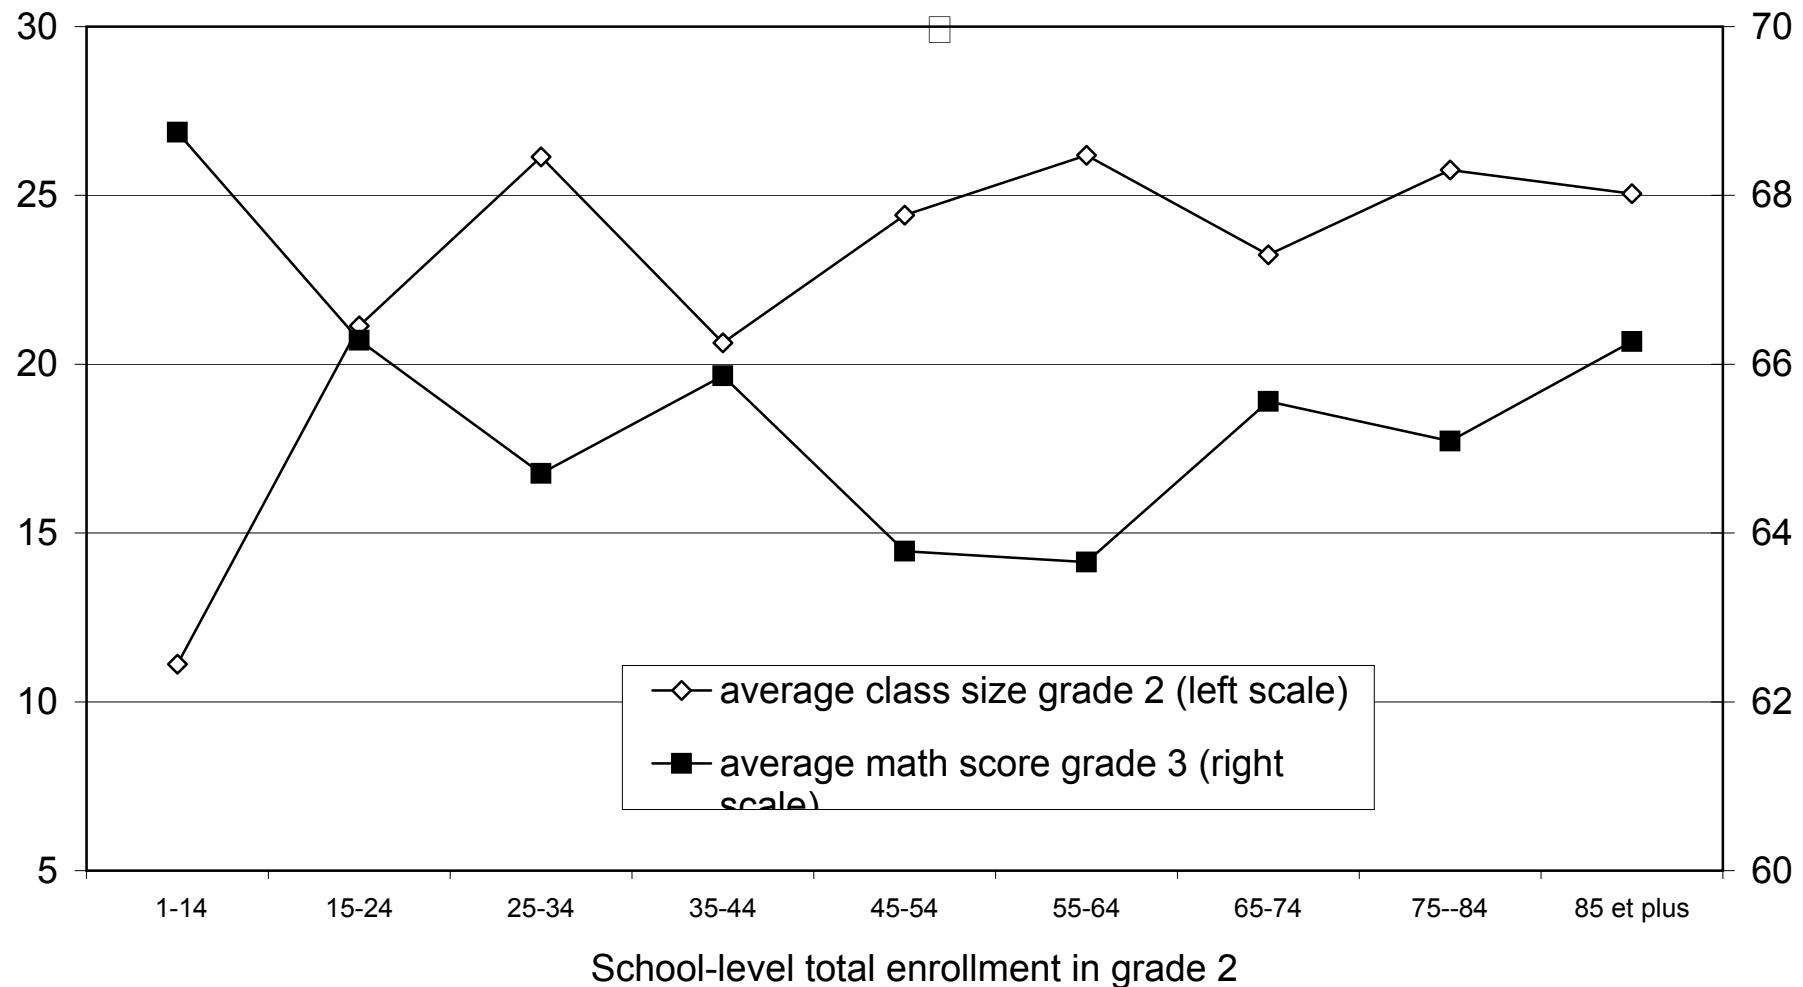

$n^*(e)$  = average theoretical class size

**Graph 2: Average grade 2 class size as a function of school-level total grade 2 enrollment in French primary schools in 1998-1999  
(schools with single grade classes in grade 2)**

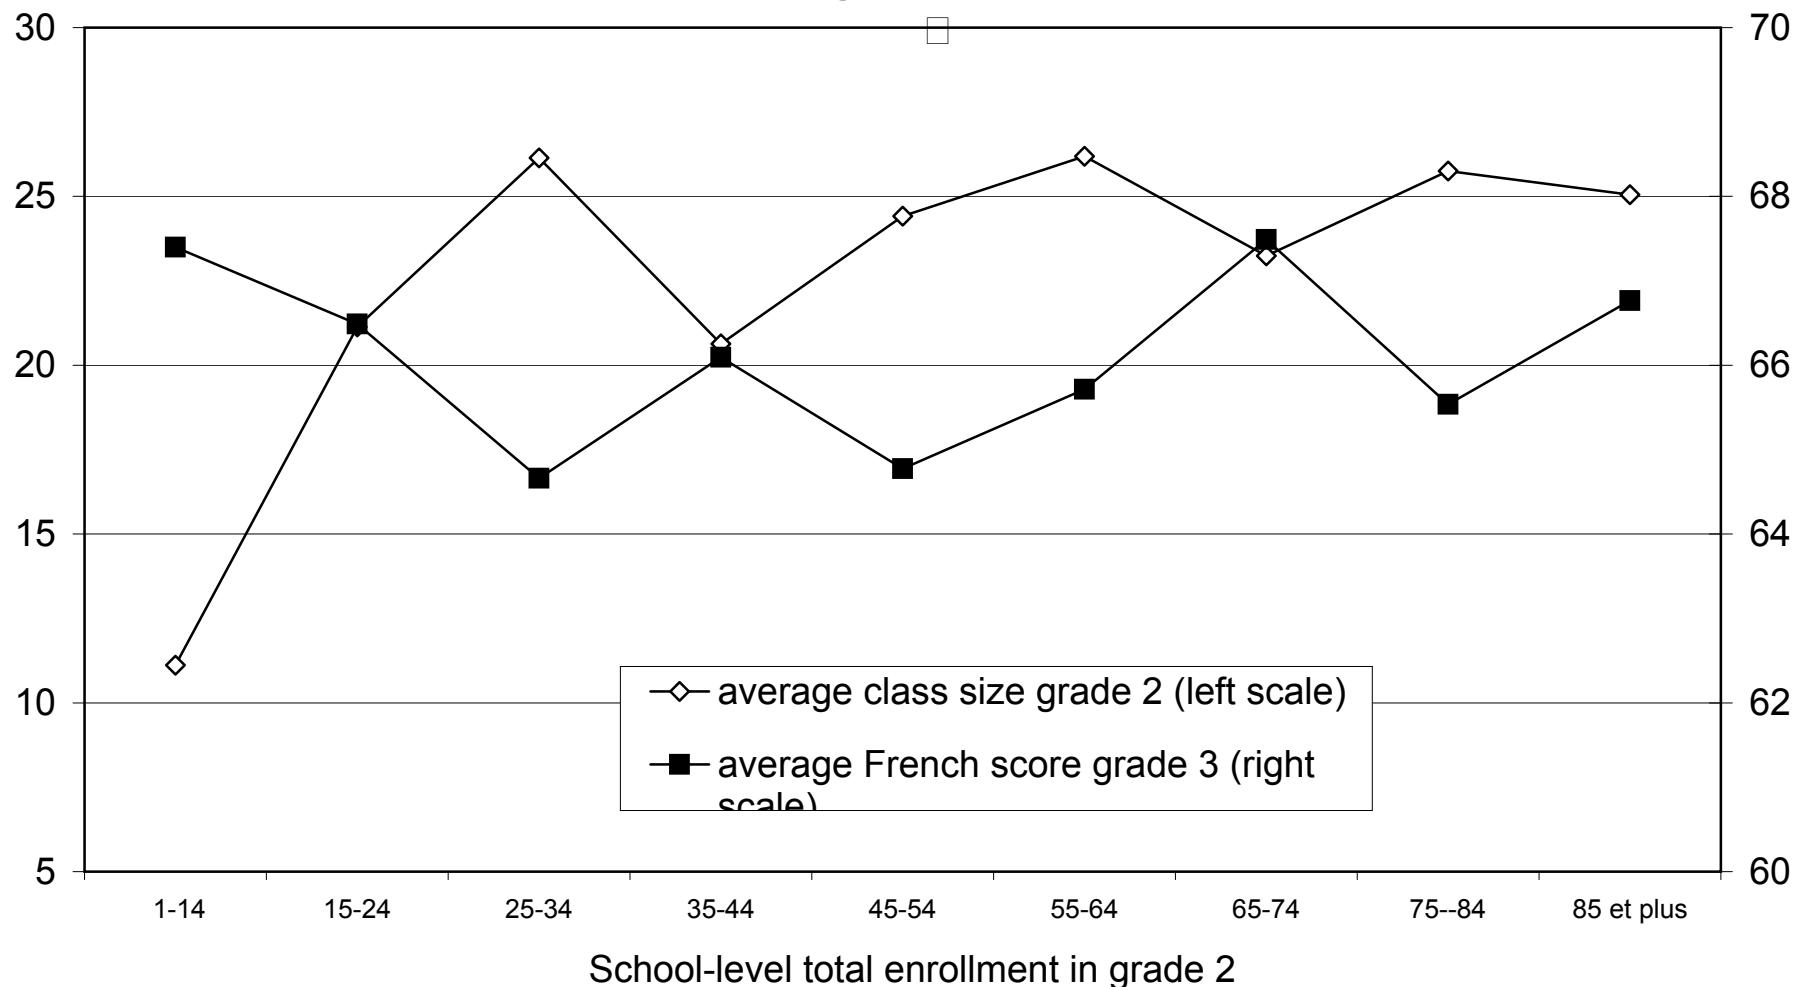

Source: Author's computations based upon exhaustive administrative files for French primary schools ("enquête n°19")

## IV Estimates

First stage :  $n_i = g x_i + h z_i + \varepsilon_i$

$n_i$  = observed grade 2 class size

$x_i$  = controls

$z_i$  = IV (e.g.  $n^*(e_i)$ )

$\varepsilon_i$  = error term

Second stage :  $s_i = b n_i^p + f x_i + \varepsilon_i$

$s_i$  = grade 3 test score

$n_i^p$  = predicted class size

$x_i$  = controls

$z_i$  = IV (e.g.  $n^*(e_i)$ )

$\varepsilon_i$  = error term

**Table 3: The impact of class size on test scores (IV estimates)**

## **Do ZEP work?**

Zep = « priority education zone » (disadvantaged schools with more financial means ; policy introduced in 1982; lots of skepticism in France; see Benabou-Kramarz-Prost 2003)

Current situation: average class size = 21,9 in Zep schools, 23,3 in non-Zep schools (grade 2)

According to my estimates, this led to a 10% decline in the inequality of school achievement between Zep and non-Zep children

Simulations : with a class size of 18,0 in Zep schools (and 24,2 in non-Zep schools), the inequality in test scores could be reduced by 40%

**Table 5: The impact of targeted class size reduction on the inequality of school simulations based upon previous estimates (targeting based upon Zep vs non-Zep)**

	Reference point: zero targeting	Current situation: low targeting in favor of Zep schools	Policy experiment n°1: high targeting	Policy experiment n°2: extreme targeting
Average class size in Zep schools	23,16	21,91	18,00	10,65
Average class size in non-Zep schools	23,16	23,33	24,16	27,88
Average grade 3 Math score in Zep schools	57,75	58,62	61,36	66,50
Average grade 3 Math score in non-Zep schools	67,68	67,64	67,43	66,50
Absolute difference in points	9,94	9,02	6,08	0,00
Reduction of the difference as compared to reference point (%)		9,2%	38,9%	100,0%

Source : Simulations based upon previous estimates (cf. tables 1 and 4). We used class size parameter of 0,7 (children in Zep schools) and 0,25 (children in non-Zep schools).

## Peer effects estimates

$$s_i = a y_i + f x_i + \varepsilon_i$$

$s_i$  = grade 3 test score

$y_i$  = peer effect variables (percentage of disadvantaged children in class, etc.)

$x_i$  = individual controls

$\varepsilon_i$  = error term

**Table 6: The Impact of School Segregation on Test Scores**
