Economics of Inequalities Class - C. Lebarz Inequality, Leverage and Crises, by M.Kumhof and R.Ranciere

・ロト ・回ト ・ヨト ・ヨト

- How high leverage and crises can arise as a result of changes in the income distribution.
- Theoretical model where a large increase in the income share of the rich and in the leverage of the remainder arise endogeneously as a result of a shift in the bargaining power over incomes

Conclusion

伺 と く き と く き と

Investors Workers Technology

Investors

- A share χ of the population (5%)
- Utility from consumption (standard CRRA) and wealth
- Wealth can take 2 forms
 - Physical capital k_t (Stone Geary form)
 - Financial investment d_t (Log form adjusted for expected losses)

イロン イヨン イヨン イヨン

Investors Workers Technology

Investors

- Losses from a crisis depend on Π_t (proba of a crisis) and on the percentage of loan or capital stocks destroyed (1 − γ_l) and (1 − γ_k)
 - Expected loan: $d_t(1 (1 \gamma_l)\Pi_t)$
 - Expected capital: $k_t(1 (1 \gamma_k)\Pi_t)$
- Lifetime Utility

$$U_{0}^{i} = E_{0} \sum_{0}^{\infty} \beta_{i}^{t} \left[\frac{(c_{t}^{i} - \bar{c}_{\min}^{i})^{1 - \frac{1}{\sigma_{i}}}}{1 - \frac{1}{\sigma_{i}}} + \zeta_{d} \log(d_{t}(1 - (1 - \gamma_{l})\Pi_{t})) + \zeta_{k} \log(\bar{k} + k_{t}(1 - (1 - \gamma_{k})\Pi_{t}))] \right]$$

イロン イボン イヨン イヨン 三日

Investors Workers Technology

Investors

 Investors are the owners of the economy's entire stock of physical capital whose law of motion is

$$k_t = (1 - \delta) \Delta_{k_t} k_{t-1} + I_t$$

$$(\Delta_{k_t} = \gamma_k < 1 \text{ if crisis, } =1 \text{ otherwise})$$

q_t: price of a deposit that pays off 1 unit of output at t+1
Investors budget constraint

$$d_t q_t + I_t + c_t^i = \Delta_{I_t} d_{t-1} + r_t^k \Delta_{k_t} k_{t-1}$$

イロン イ部ン イヨン イヨン 三日

Investors Workers Technology

Workers

- A share 1χ of the population (95%)
- Utility from consumption (same standard CRRA with subsistence level)

$$U_{0}^{k} = E_{0} \sum_{0}^{\infty} \beta_{k}^{t} \left[\frac{(c_{t}^{k} - \bar{c}_{min}^{k})^{1 - \frac{1}{\sigma_{k}}}}{1 - \frac{1}{\sigma_{k}}} \right]$$

They supply inelastically one unit of labor per capita

$$(\mathsf{BC}) w_t + l_t q_t = \Delta_{l_t} l_{t-1} + c_t^w$$

 They default on their loan obligation with proba Π_t (Increasing in their debt to income ratio according to a logistic function)

Investors Workers Technology

Technology

Aggregate production function

$$y_t = A(\chi \Delta_t^k k_{t-1})^{\alpha} (1-\chi)^{1-\alpha}$$

 Factors returns are determined by the outcome of a Nash Bargaining over the real wage (η_t bargaining power)

 Max_{w_t} (Workers surplus)^{η_t} (Investors surplus)^{$1-\eta_t$}

(FOC) $w_t = \eta_t * \text{marginal product of labor}$

• η_t follows an autoregressive stochastic process given by

$$\eta_t = (1-\rho)\bar{\eta} + \rho\eta_{t-1} + e_t^n$$

Investors Workers Technology

Equilibrium

- Maximization of investors and consumers utilities
- Market clearing conditions
 - for goods

$$y_t = \chi(c_t^i + I_t) + (1 - \chi)c_t^w$$

for financial claims

$$(1-\chi)I_t = \chi d_t$$

Conclusions

- The crisis barely improve workers situation (while their loan drop by 10% due to default, their wage also drops significantly and the real interest rate on remaining debt shoots up to raise debt servicing)
- By contrast, restoration of poor and middle income households' bargaining power can be very effective (sustained reduction in leverage that should reduce the probability of a further crisis)
- Link between crisis and leverage: the specification of the crisis probability
- Extend this to open economy (same mechanism) and explain current account imbalances triggered by income inequality in surplus countries
